

Real-time Quantity Available-To-Ship For Customer Orders

This utility automatically recalculates the quantity available-to-ship based on the customer's needed date (versus the order date)

This PULSE Utility will give you accurate real-time available-to-ship quantities for customer orders. The utility reserves on-hand quantities based on when the customer needs the product versus when the order was entered.

Example: You have an on-hand quantity of 1,000 of your top-selling product. Today, you entered an order for 1,000 to be shipped next month. Tomorrow, you enter another order for 100 that needs to be shipped immediately. The Macola® software would tell you that you do NOT have any available to ship when in fact it is available.

In the above example, the Macola® software reserves the total ordered quantity of 1,000 even though it does not need to be shipped for one month in the future. The Macola® says you cannot print picking tickets tomorrow when there are sufficient quantities.

Our PULSE utility accurately recalculates the inventory quantity available for each customer order. Your Macola software will now display the correct quantities that are available to ship. Accurate picking tickets can also now be printed.
